Numerous central nervous system demyelinating disorders exist, including multiple sclerosis. Although demyelination is the major manifestation of most of the demyelinating diseases, recent studies have clearly documented concomitant axonal loss to varying degrees resulting in long-term disability.

A Mechanism of Virus-Induced Demyelination

Demyelinating diseases are traditionally classified in two kinds: demyelinating myelinoclastic diseases and demyelinating leukodystrophic diseases. In the first group, a normal and healthy myelin is destroyed by a toxic, chemical, or autoimmune substance. In the second group, myelin is abnormal and degenerates.

Viral infections are considered to trigger multiple sclerosis (MS), which is an inflammatory demyelinating disease of the central nervous system (CNS). Clinically, several viruses, including human herpesvirus 6, have been isolated from MS patients, and higher antiviral immune responses have been reported in MS patients than in healthy controls .
